

1. Tools for electronic circuit assembly

✂ For each picture, put its name

- Stripboard
- Desoldering pump
- Tin ('tɪn)
- Stand ('stænd)
- Soldering iron ('aɪə'n)
- Wire stripper ('waɪə' 'stri:pə')
- Desoldering wire
- Cutting pliers ('kʌtɪŋ' plaɪə'z)

2. How to solder

✎ Complete each image with its description.

- Insert components and splay the leads so that the part is held in place.
- It only takes a second or two, to make the perfect joint, which should be nice and shiny.
- Continue heating and apply a few millimetres of solder. Remove the iron and allow the solder joint to cool naturally.
- Apply a clean iron tip to the copper and the lead in order to heat *both* items at the same time.
- Boards must be clean to begin with, especially if they're not previously "tinned" with solder.
